SUMMARY

Full stack and mobile developer with a B.Sc. in Information Technology, building web and cross-platform apps with Laravel, React, and Flutter. Built AI-powered apps using LLM APIs and RAG, and real-time systems with WebSockets, with a focus on clean, well-tested backends. Seeking a junior full stack or mobile developer role.

TECHNICAL SKILLS

Languages: JavaScript (ES6+), PHP, Dart, Python, SQL, Solidity
Frameworks: Laravel, React, Flutter, Node.js (Express), FastAPI, Tailwind CSS
AI & Backend: REST APIs, LLM / AI API Integration, RAG & Embeddings, WebSockets, PostgreSQL, MySQL, SQLite, Firebase
Tools: Git/GitHub, GitHub Actions (CI), Docker, PHPUnit, Microsoft Azure, Figma

PROJECTS

Recall — AI Study Assistant

Flutter, Riverpod, Laravel, Sanctum, AI API (LLM & Embeddings), PHPUnit | [GitHub](#)

- Built a mobile app that turns uploaded lecture notes and PDFs into AI-generated flashcards and quizzes, with a Laravel backend that validates structured AI output and retries malformed responses.
- Implemented "chat with your notes" using RAG: documents are extracted page by page, chunked, and embedded in a Laravel queue job, and questions are answered from the most relevant passages using embedding similarity search, with page-level citations.
- Implemented the SM-2 spaced repetition algorithm with unit tests, plus per-user token limits, rate limiting, and retry with exponential backoff to handle API limits.

Restaurant QR Menu & Ordering System

Laravel, React, Laravel Reverb, Sanctum, MySQL, Tailwind CSS, Docker (Laravel Sail) | [GitHub](#)

- Built a full-stack table-service app where customers scan a table QR code and order without an account from a trilingual menu (Kurdish, Arabic, English) with full RTL support.
- Built role-based dashboards: a kitchen Kanban board, a waiter floor board for ready orders, service calls, bill requests, and table closing, and an admin panel for menus, tables, QR codes, staff, and sales analytics, with real-time updates over WebSockets (Laravel Reverb).
- Enforced business rules on the server, including price calculation from the database to prevent cart tampering and order-flow checks (e.g. tables can't close with active kitchen orders), covered by PHPUnit feature tests in GitHub Actions CI.

HealthTrust — Blockchain Medical Records (Graduation Project)

React, Node.js (Express), PostgreSQL (Prisma), Solidity (Hardhat, Sepolia), IPFS, Python (FastAPI, scikit-learn) | [GitHub](#)

- Team project in which I helped develop the code and write the project report: a patient-controlled medical records platform with separate workspaces for patients, doctors, and institution admins.
- Files are AES-encrypted in the browser and stored on IPFS, while Ethereum smart contracts hold record references, access permissions, and audit events; doctors can open a record only with both on-chain access and an encrypted key issued to their MetaMask wallet.
- Includes a FastAPI diabetes risk prediction service built with scikit-learn (88% accuracy), integrated with the Node.js backend, plus exportable PDF audit reports.

EXPERIENCE

Intern — IQ Online

Jun 2025 – Aug 2025

- Gained hands-on exposure across networking, cloud infrastructure (Microsoft Azure), and software development teams, learning how systems and applications are run in a production environment.
- Learned professional team workflows, including Git-based collaboration, code reviews, and Agile sprints.

EDUCATION

B.Sc. in Information Technology — Sulaimani Polytechnic University

2026

- Consistently ranked in the top 3 of my class.
- Relevant coursework: Web Development, Mobile Application Design, Database Systems, Software Engineering, Data Structures & Algorithms

LANGUAGES

Kurdish (Native) • English (Fluent) • Arabic (Professional Working Proficiency)
